Customer Script - Pricing O4AA

Step 1:

- Understand your customer's AI adoption stage to determine the number of Agent-to-Identity Connections required for the customer.
- Guiding questions:
    - Describe to me what stage you are at in deploying agentic AI. Are you piloting to a few teams, scaling usage across the company, or already have company wide agentic AI solutions?
    - What percentage of your users do you expect to use agentic AI? (Then translate to number of users)
    - On average, how many agents would you expect your average user to be assigned to? (our research shows that most companies fall in the 1 - 3 range; only consider agents that act across applications, i.e. not an agent that only acts in its native platform).
    - The Okta Secures AI team is testing the below internal pricing guidance for sales positioning:

Internal Pricing Guidance for O4AA Sales Positioning

Internal Guidance: (1) Understand your customer's AI adoption stage, (2) align to connection count recommendation, (3) during pricing review and deal sizing, explain Agent-to-Identity Connection count aligned to recommendation

When to Recommend	What the Customer is Trying to Do	How Sellers should talk about it	Agent-to-Identity Connection Count
Early AI adoption	* Pilot AI agents * One team or function	"This is a good starting point if you're piloting AI in one team and want visibility and control without overthinking scale."	Includes AI identity coverage aligned to: **1 x UD user count**
Scaling usage	* Multiple teams using AI * Shared agents across departments *Need consistency and control	"Most customers land here once AI moves beyond a single team and becomes shared across the business."	Includes AI identity coverage aligned to: **2 x UD user count**
Mature Adopter of Agentic AI / Agentic AI Pioneer	* Broad employee access to AI * High automation density * Security, risk, and audit concerns	"This is designed for company-wide AI usage where security and governance need to scale with adoption."	Includes AI identity coverage aligned to: **3 x UD user count**
Non-standard needs	* Large workforce * Uneven AI adoption * Strategic or regulated environments	"If your AI usage doesn't map cleanly to a standard rollout, we can size this to fit how you actually operate."	Custom connector counts

Step 2:

- Explain the Agent-to-Identity Connection definition using [External] Pricing - Okta for AI Agents
- Slide 1
    - Okta for AI Agents is priced in the unit of measure "Agent-to-Identity Connections"
    - First, I'll walk through what an "Agent-to-Identity Connection" is and how we count them in Okta

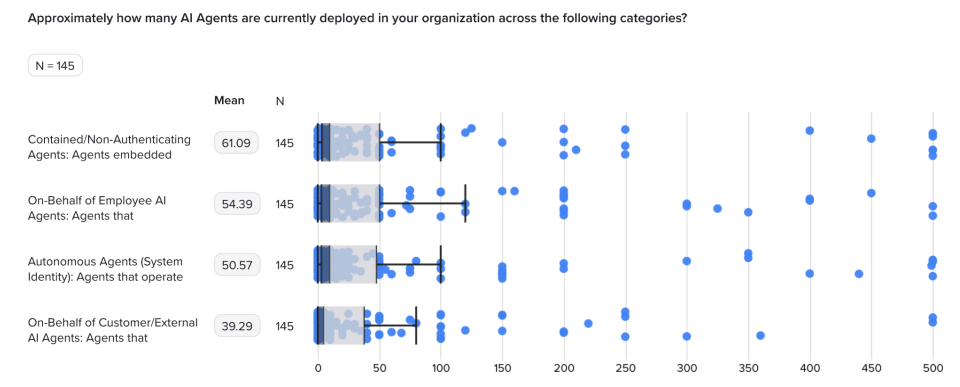
    - An "Agent-to-Identity Connection" is the unique assignment of an AI Agent to an User Identity that the AI Agent may authenticate on-behalf-of.
    - Looking at the example below, Agent A is assigned 1 User, User A, Agent B is assigned to 1 User, User B, and Agent C is assigned to 3 users, User A, B, and C. That sums to 5 Agent-to-Identity Connections
    - [*If the customer is familiar with Okta Workforce licensing*] Think of it as an extension of your existing per-User workforce pricing. For each User in Okta, we count an Agent-to-Identity Connection for each Agent that User is assigned to.
    - Okta uses this price meter because it directly ties to the value of our product: securing the connection between an Agent and the User the Agent acts on behalf of
- Slide 2
    - To bring this to life, let's take a look at how this will look in the Admin console.
    - For each Agent in Okta, you can view the User identities assigned to the Agent in the Assignments tab of the Agent Application
    - Each of this Agent's assigned Users represents an Agent-to-Identity Connection that we count
    - Keep in mind that if the users you see in this screenshot are assigned to multiple Agents, that counts as multiple Agent-to-Identity Connections
- Slide 3
    - To further illustrate, let's review and example:
    - Customer A has a workforce of 1,000 users. They have 2 AI Agents used by their entire workforce (for example an HR agent that can book travel and submit expenses or a calendaring agent) and 1 AI Agent used just by the 100 person engineering team (for example an incident response agent that can pull logs, create Jiras, and send slack messages)
    - That sums to 2,100 Agent-to-Identity Connections: 1,000 for Agent A, 1,000 for Agent B, and 100 for Agent C

Step 3:

- Tie back to the number of connections you are planning to include in the customer's pricing, highlighting the benefits of the Agent-to-Identity Connection model
- Tips:
    - Frame as a total count and also as an average per-User Agent count
        - E.g. "1,000 total Agent-to-Identity Connections or an average of 2 Connections per User"
    - Explain the customer benefits of this model using their connection count:
        1. Our connection based licensing model means that there is **no per-User Agent cap**. You can use Agent-to-Identity Connections across any combination of Users and Agents you want
            - E.g. "With 1,000 connections, you can have 500 users with 2 connections each or 100 users with 10 connections each."

- You have the **flexibility to scale** up and down agents across teams since Okta only counts Agent-to-Identity Connections for Agents and Users in an Active Status
    - E.g. “With 1,000 connections, you can spin up Agent A today with 1,000 users, then tomorrow you can deactivate Agent A and spin up Agent B with 1,000 users, all while staying within your 1,000 connection count”

- Agents managed in Okta (on-behalf of employees) typically ~25% of total agents



-
- Agents typically have functional specific deployments (ref: Okta Secures AI_Pricing Committee_251219)
- 150 of your peers helped us understand that as a median we'd expect 1-2 connections per employee with 10% p.a. Growth expected - we can use this estimate to quickly estimate license counts *(or do a diagnostic with our plug in / ISPM for add'l precision)*
